This transport system plays an essential role in the energy supply of tropical rhizobium-legume symbionts. SUBCELGUIAR LOCATION: Integral membrane protein. Inner membrane. INDUCTION: By succinate, fumarate, and malate. Expression depends on the rpon sigma factor.

"Stereochemical course of hydrolysis catalysed by Cellulomonas fimi
Cent. a member of a new family of beta-1,4-glucanases.";
Biochem. Biophys. Res. Commun. 199:1223-1228(1994).

"FONCTION: HYDROLYSE CELLOHERAGSE TO A MIXTURE OF CELLOTETRAOSE,
CELLOTRIOSE AND CELLOBIOSE, MITH ONLY A TRACE OF GLUCOSE. IT
HYDROLYSED CELLOPENTAOSE TO CELLOTRIOSE AND CELLOPINSE AND CELLOPINSES CELLOTRIOSE.

"HAS ALSO WEAK ENDOCLICANASE ACTIVITY. HYDROLYSES GLUCOSIDIC BONDS
WITH INVERSION OF ANOMERIC CONFIGURATION.

"I CATALYTIC ACTIVITY: Hydrolysis of 1,4-beta-D-glucosidic linkages
In cellulose and cellotetraose, releasing cellobiose from the non-reducing ends of the chains.

"I SIMILARITY: CONTAINS 3 FIBRORECTIN TYPE III-LIKE DOMAINS.

"I SIMILARITY: CONTAINS 1 BACTERIAL-TYPE CELLULOSE-BINDING DOMAIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrella burgdorferi B131, but not reactive with most proteins from ther spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most cother spirochaetes. (I), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato. (I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The I3 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis, compared with use of whole bacteria as antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a Borrelia garinii IP90 protein. The

present invention describes an isolated nucleic acid (1) that: (1) encodes a polypeptide fragment (II) immunologically reactive with encodes a polypeptide fragment (II) immunologically reactive with crabbit polyclonal antibody raised against a 13 kpa polypeptide of crabbit polyclonal antibody raised against a 13 kpa proteins from other spirochaetes; and/or (11) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most to specific nucleic against infection by B. burgdorferi sensu lato. (I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The 13 kp protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 GSFAQGDILGGFLILGFDAVGIGLILTGAYLDIKALDKNAPKAAFKWTWGKGMMLAGAVT 120

                                                                       invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a Borrelia burgdorferi B313 protein. The present invention describes an isolated nucleic acid (I) that: (i) encodes a polypeptide fragment (II) immunologically reactive with rabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from other spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most
                                                                                                                                                                                                                                                                                                                                                            IGSFAQGDILGGSLILGFDAVGIGLILTGAYLDIKDFDNNAKKADFKWTWGKGMMLAGVV 118

          vaccines to protect dataset infection by B. burgdorferi sensu lato.
(I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The I3 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide ompared with use of whole bacteria as antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members the Borrelia genus, particularly for the use against Lyme disease in

```

The present sequence

compared with use of whole bacteria as antigen. The prese represents a p11 protein sequence from a best hit search.

The present invention describes an isolated nucleic acid (I) that: (i) encodes a polypeptide fragment (II) immunologically reactive with rabbit polychothal antibody raised against a 13 kba polypeptide of crabbit polychothal antibody raised against a 13 kba polypeptide of crabbit polychothacter; balls, but not reactive with most proteins from cher spirochaetes; and/or (ii) hybridizes under stringent conditions of the spirochaetes. (I), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato.

(I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The 13 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis,
                                                                                                                                                  ï
humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.

The present sequence represents a Borrelia burgdorferi B313 N-terminal peptide. The present invention describes an isolated nucleic acid (I) that: (i) encodes a polypeptide fragment (II) immunologically reactive with rabbit polyclonal antibody raised against a 13 Kba polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from conter spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most to specific nucleic against infection by B. burgdorferi sensu lato.

Crosporines to protect against infection by B. burgdorferi sensu lato.

(I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The I3 Kb protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis, compared with use of whole bacteria as antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (NIMR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulaters. NIMR nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infectioity of a microbe on a surface, and the virulence of a microbe in a subject suffering from an infection. AAU29339-AAU39379 represent Escherichia coll NIMR amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying compounds that modulate a newly identified mar regulated

The present invention describes a purified or isolated nucleic acid
sequence (I) consisting essentially of one of the 93 nucleotide sequences
given in AARB1202 to AARB1204, where expression of the nucleic acid in a
microorganism is capable of inhibiting proliferation of a microorganism.

(I) have antibacterial and antibiotic activities, and can be used in
gene therapy. Expression of (I) in a microorganism inhibits proliferation
of the microorganism, and the manufactured antibiotic is useful for
reducing the activity or level of a gene product required for
reducing the activity or level of a gene product required for
cucleic acids that inhibit bacterial growth or proliferation can be used
as antisense therapeutics for killing bacteria. In addition to
therapeutic applications, the nucleic acid sequences complementary to
sequences required for proliferation can be used as diagnostic tools.
For example, nucleic acid probes complementary to proliferation required
sequences that are specific for particular species of microorganisms can
be used as probes to identify particular microorganism species in
clinical specimens. AAHB1295 to AAHB1487 encode the Escherichia coll
proteins given in AAG98239 to AAG8431, and AAHB1488 to AAHB1480
represent oligonucleotides, which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coll or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the

The nucleic acids are expressable in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce

the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma-membrane associated broteins essential to exocytosis, and where the second domain is adapted; (a) to translocate the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the first domain on its own, the protein compared to the solubility of the first domain on its own, the protein being free of clostridial neurotoxin (CN) and free of CN precursor that can be converted into toxin by proteolytic action. The recombinant can be used as the protein and as non-toxic standards for the assessment and development in immunogens and as non-toxic standards for the assessment and development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vitro assays for the detection of functional botulinum or tetanus

                                                                                                                                                                                                                                                                         :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein.
                                                                                                                                                                                                                                                                                                                                             Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmetic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium

```
The present sequence represents a construct of the invention, comprising a manganese superoxide dismutase (Mn.50) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype B. The specification describes a composition for delivery of 50D to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a
                                                                        GIGLILTGAYLD-----IKDFDNNAKKADFKWTWGKGMMLAGVVTMAVTRL----- 125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    domain that translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma,

```

```
The present sequence represents a construct of the invention, comprising a mitochondrial leader sequence from human manganese superoxide dismutase (Mn-SoD), a Bacillus stearothermophilus Mn-SoD, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype B. The specification describes a composition for delivery of SoD to neuronal cells. The composition comprises SoD linked, by a cleavable linker, to a neuronal cell to a neuronal cell and a domain that translocates the SoD of the composition into the neuronal cell. After translocates the SoD of the composition into the neuronal cell. After translocates the subject is cleaved to release the SOD. The composition is useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and

Sequence 5006, Application US/09938842A

Patent No. US20020160378A1

GENERAL INFORMATION:
APPLICANT: Harper, Jeff
APPLICANT: Kreps, Joe1

APPLICANT: And, Tong
TITLE OF INVENTION: STRESS-REGULATED GENES OF PLANTS, TRANSGENIC PLANTS CONTAINING
TITLE OF INVENTION: SAME, AND METHODS OF USE
FILE REFERENCE: SCRIP1300-3

CURRENT APPLICANTION NUMBER: US/09/938,842A

CURRENT APPLICATION NUMBER: US 60/227,866

PRIOR FILING DATE: 2001-08-24

PRIOR FILING DATE: 2001-01-16

NUMBER OF SEQ ID NOS: 5379

SEQ ID NOS: 5379
                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
